

Introducing Mainframe Networks - Learning Pathway

The “Introducing Mainframe Networks” Learning Pathway incorporates existing generic e-learning in the form of Datatrain course modules, with the details of your systems environment, and the standards and practices used by your organization.

The “**Our Mainframe Networks**” PowerPoint module appearing in the pathway is to be used by your own presenter, and contains templates providing an overview of the SNA and TCP/IP mainframe configuration at your site. This includes SNA nodes and their uses, TN3270 emulation, and TCP/IP itself. Notes are provided with each slide explaining what your presenter needs to customize, and what information should be discussed in the audio component.

The “**Our Mainframe Network Operations**” PowerPoint module covers how your mainframe network operations are performed. It includes information needed to issue commands, use network facilities and manage network related resources. It also covers network administration tools at your site.

The “**Understanding Mainframe Networks and Your Role**” PowerPoint module that appears at the end of the pathway is to be used in a Webinar environment and uses the expertise within own organization to impart information about the mainframe network issues, priorities and support personnel required by your learners. The Webinar format allows the learner to interact with the presenter with various scenarios associated with mainframe networks, and the individual and team role they play. It also looks at priorities and current and future mainframe network related projects currently underway in your organization.
